This document summarizes the lighting and receptacle control requirements for commercial buildings. It is for information purposes only. It is not meant to replace your state’s or local jurisdiction’s official energy code. The recommendations presented in this guide are based on the originally published code prior to addenda. Please refer to your local building energy code or authority having jurisdiction for your precise requirements. Only the authority having jurisdiction can guarantee code compliance.

** Requires QS Timeclock
† Automated Demand Response capability requires signal from a third-party device.
### Summary of Requirements for Interior Lighting and Receptacle Controls

**ASHRAE 90.1-2013**

The requirements listed below are summarized for simplicity and may have other exceptions that were omitted.

#### Local Control

<table>
<thead>
<tr>
<th>Switching</th>
<th>Lighting shall be capable of turning ON and OFF. There shall be at least one manual device for control of the lighting within a space. See code for spaces that allow remote location of control.</th>
<th>9.4.1.1 (a)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multi-level or dimming</td>
<td>Lighting shall be capable of providing at least one level between 30% and 70% of full power, in addition to ON and OFF. There shall be at least one manual device for control of the lighting within a space. See code for spaces that allow remote location of control.</td>
<td>9.4.1.1 (a) &amp; (d)</td>
</tr>
</tbody>
</table>

#### Timeclock

<table>
<thead>
<tr>
<th>Timeclock</th>
<th>Interior: Scheduled control, based on time-of-day, turns lighting ON or OFF based on typical occupancy. Occupancy sensors also comply as an alternate to using a timeclock. Exterior &amp; parking garages: Scheduled control, based on time-of-day and sunrise/sunset, turns lighting ON or OFF based on typical occupancy and daylight (requires astronomical timeclock).</th>
<th>9.4.1.1 @</th>
</tr>
</thead>
<tbody>
<tr>
<td>Occupancy sensor</td>
<td>Automatic control turns lighting ON upon occupancy or OFF after a vacancy of 20 minutes or less.</td>
<td>9.4.1.1</td>
</tr>
<tr>
<td>Full ON</td>
<td>When initiated by a timeclock or occupancy sensor, lighting is automatically turned ON to maximum lighting power.</td>
<td>9.4.1.1 (b)</td>
</tr>
<tr>
<td>Partial ON</td>
<td>When initiated by a timeclock or occupancy sensor, lighting is automatically turned ON to 50% or less of maximum lighting power.</td>
<td>9.4.1.1 (c)</td>
</tr>
<tr>
<td>Full OFF</td>
<td>When initiated by a timeclock or occupancy sensor, lighting is automatically turned OFF.</td>
<td>9.4.1.1 (f)</td>
</tr>
<tr>
<td>Partial OFF</td>
<td>When initiated by a timeclock or occupancy sensor, lighting is automatically reduced by at least 50% of maximum lighting power (30% for enclosed parking garages and exterior). Automatic full OFF also complies.</td>
<td>9.4.1.1 (g) &amp; 9.4.1.2 (b) &amp; (c) &amp; 9.4.1.4 (c)</td>
</tr>
</tbody>
</table>

#### Automatic Control

<table>
<thead>
<tr>
<th>Daylight responsive control</th>
<th>Interior: A sensor which adjusts lighting in response to available daylight is required for sidelighting and skylighting zones. There must be at least two light levels between ON and OFF. See the “Daylight Zone Requirements” diagrams for more information. Exterior and parking garages: A photosensor can be used as an alternate to the dawn/dusk operation of an astronomical timeclock. The perimeter 20 ft. of parking garages with access to daylight must automatically reduce lighting power in response to daylight.</th>
<th>9.4.1.1 (e)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receptacle control</td>
<td>At least 50% of the receptacles in the space shall automatically turn OFF based on typical occupancy or after a vacancy of 20 minutes or less. Plug-in devices do not comply.</td>
<td>8.4.2</td>
</tr>
</tbody>
</table>

#### Other

| Daylight Zone Requirements | Pictures in the primary and secondary daylight zones must be independently controlled by zone. Sidelighted zones must be controlled separately from top lighted zones. | Daylight Exceptions: Daylight control is not required when the total lighting power of a daylight zone is less than 150 W or when the total glazing area is less than 20 sq. ft. |

---

For areas being used as a path of egress or fixtures being used for emergency, verify compliance with your local authority having jurisdiction. Acceptance (functional) testing is required for all new construction applications to ensure that control hardware and software are calibrated, programmed and functioning properly (Code provision 8.4.2).

1. When multi-level lighting control and/or daylight responsive control is required, Lutron recommends using continuous dimming to allow for smooth light level adjustment and maximize energy savings.
2. Lutron recommends using occupancy sensors to achieve automatic on/off requirements in place of a timeclock to maximize energy savings and optimize user experience.
3. Manual ON is always permitted for interior applications. Provide manual ON control when no automatic ON is indicated.
The compliant solutions listed below are suggested based on total installed cost, simplicity of design, and basic functional needs for the space. These solutions do not represent the only compliant options to meet lighting and receptacle control requirements. Applications in this guide will illustrate these solutions and/or alternative solutions for advanced functionality.

### Diagram key:

- = New construction

### Notes:

1. Retrofit requirements indicated are for lighting alterations greater than 10% of the connected load in a space.
2. Manual ON is always permitted for interior applications. Provide manual ON control when no automatic ON is indicated.
3. When typically occupied, the sensor provides Partial OFF functionality. When typically unoccupied, the sensor provides Full OFF functionality. For entrances and exits, lights are scheduled to Full OFF when typically unoccupied and Partial OFF at night; daylighting and occupancy sensing are not required.
4. For areas not designated as a path of egress, the occupancy sensor must turn lights to full OFF.
5. Astronomical timeclock shall ensure all lights are off during daylight hours. Lights should be scheduled to partial OFF during night hours (not required in lighting retrofits). See section 9.4.1.4 for scheduling times.
How to Use this Guide
ASHRAE 90.1-2013

This application guide is designed to help specifiers and contractors understand codes and Lutron controls in a simple manner. Each of the pages will lay out different spaces, the corresponding lighting control products and the way the system is setup in the space.

For Specifiers
Use this application guide for design suggestions, the way the system operates and to specify the relevant products for each space.

For Contractors
Use this application guide to understand how the system is installed, the way the system must operate and to order the correct products for each application.

This guide offers up to three solutions per space type.
- **The Retrofit Solutions** are simple and inexpensive solutions, generally suited for a basic retrofit.
- **The New Construction Solutions** are value driven, generally best suited for new construction.
- **The Recommended Solutions** have advanced functionality for greater comfort and energy savings.

### Classroom | New Construction

**Visible System Components**

**Control Functionality**

**Occupant Enters:**
- Lights do not automatically turn on when an occupant enters the space; lights must be turned on manually. Maximum light level is set to 80%.
- Controlled receptacles automatically regain power when occupant enters.

**When Occupied:**
- Automatic: Overhead lights dim/brighten based on daylight availability. There are two perimeter daylight zones.
- Manual: Occupant uses wall dimmers to set desired light levels for both general and white-board lights.

**Occupant Exits:**
- All lights automatically turn off 15 minutes after all occupants exit.
- 50% of all receptacles automatically turn off 15 minutes after all occupants exit.

**Add a Vive wireless hub to enable simple setup and re-zoning, system monitoring, timeclock functionality, and advanced integration.**

**Code Notes:** For line-voltage systems, all general lighting is connected to a single 0-10V dimming module.

**Guide Notes:** For more depth information, all general lighting can be connected to a single 0-10V dimming module. For a complete list of options, please visit lutron.com.

**Learn about the products used in the space**

**Learn what energy savings you achieve over manual shut-off.**

**Learn what strategies are implemented in the space.**

**Learn how the space functions with the installed system.**
This is a high-level overview of the local solutions layout. For individual room requirements refer to the detailed room type solutions in this guide. A single PowPak module can control a single or multiple fixtures. The products shown here are representative of local solutions. Multiple product options are available to meet the needs of the space.

- Vive wireless hub*
- PowPak module
- Occupancy sensor
- Pico wireless remote control
- Daylight sensor

**Vive wireless hub Features:**
- Central control, management, and monitoring of Vive devices via web browser
- Supports astronomic and time-of-day events
- Two contact closure inputs for 3rd party integration such as Automatic Demand Response
- WiFi access for easy commissioning
- Control up to 10,000 sq. ft. with a single hub
- Optional BACnet integration

* Go to lutron.com/vive for complete compatibility and design details

Want to add a Vive wireless hub for more features? Go to lutron.com/vive for complete compatibility and design details.
Visible System Components

Control Functionality

- **Occupant Enters:** All lights automatically turn on to maximum light level. Maximum light level is set to 80%.

- **When Occupied:**
  - Manual: Occupant uses wall dimmer to set desired light levels for all lights. Manual control cannot fully shut off the lights. Minimum light level is set to 10%.

- **Occupant Exits:** All lights automatically go to minimum light level 15 minutes after all occupants exit.

- **Emergency Mode:** Lighting connected to emergency power turns on to full output.

Control Strategies

- **Auto On Partial Off**
  - **Occupancy/Vacancy**
    - Max: 100%
    - Max: 85%

- **High-end Trim/Tuning**

Lighting Energy Savings*

60%

* Go to lutron.com/references for more information.

**Code Notes:**
- Verify that the egress fixtures go to full output upon loss of control signal. For projects that require UL 924 compliance, provide an automatic load control relay (ALCR) per load controller connected to emergency fixtures. Add a daylight sensor for corridors with daylight zones. Want to add a Vive wireless hub for more features? Go to lutron.com/vive for complete compatibility and design details. This solution requires 0-10V enabled ballasts and drivers by others.

- For non-egress corridors, set the minimum light level to full off.

Visible System Components

Control Functionality

Occupant Enters:
All lights automatically turn on to 50% light level. Occupant turns on lights to maximum level manually. Maximum light level is set to 80%.

Controlled receptacles automatically regain power when occupant enters.

When Occupied:
Automatic: Overhead lights dim/brighten based on daylight availability. There are two perimeter daylight zones.

Manual: Occupant uses wall dimmers to set desired light levels for all lights.

Occupant Exits:
All lights automatically turn off 15 minutes after all occupants exit.

50% of all receptacles automatically turn off 15 minutes after all occupants exit.

Control Strategies

- Occupancy/Vacancy
- Partial On Auto Off
- Full On Dim
- Daylight Harvesting
- High-end Trim/Tuning
- Appliance On Appliance Off
- Plug Load Control
