

Occupancy Sensing in Hallways – Switching Solution

School hallways are often vacant while classes are in session. By turning lights off in empty hallways and automatically turning them on during passing periods, or when someone enters the hallway, schools can reduce lighting electricity use and redirect those funds to critical classroom programs.

Based on the hallway occupancy information received from the Radio Powr Savr™ hallway sensor, the PowPak™ relay automatically turns lights on when someone enters the space, and off when the space is vacant.

Occupancy Sensing in Hallways – Dimming Solution

The PowPak™ with EcoSystem® saves energy by automatically increasing light levels when hallways are occupied and reducing light levels when they are unoccupied.

The occupied and unoccupied light levels are field adjustable to be specific to the project's code requirements.
