

Save energy

Metal halide lighting systems are a drain on your energy budget. Athlite alleviates this strain by:

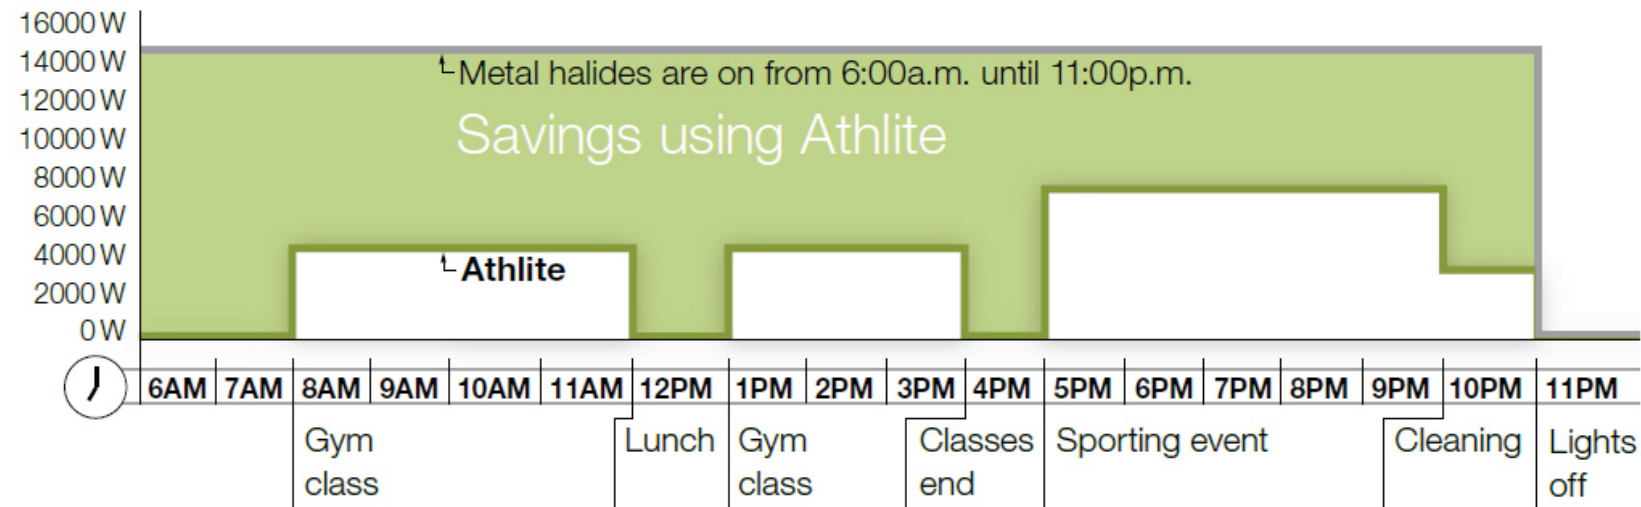

- Reducing the initial wattage of each fixture by 45 – 50%
 - Reducing lighting levels depending on the event or time of day
- Athlite combines high-performance fluorescent lighting with state-of-the-art controls to provide significant energy savings.

Before: Metal halide lighting systems create glare and uneven illumination, known as “hot spots.”

After: Athlite creates a more evenly illuminated surface and reduces blinding overhead glare, providing a high-performance athletic environment for your students and community.

Energy Consumption

Athlite saves 50-80% over equivalent metal halide systems.
