

Product Types

Dimmer

A dimmer is used to lower the output of your lights. There should only be one “master” dimmer used per lighting circuit. To dim from multiple locations (only available with digital dimming), a “companion” dimmer must be utilized.

Switch

A switch allows for “on/off” control of your lights only. Our digital switches must be used in conjunction with Lutron companion switches to accomplish 3-way or 4-way installations. Our mechanical switches (Claro) may be used with standard toggle switches.

Companion Dimmer

A companion dimmer allows for dimming from multiple locations. Companion controls must be used in conjunction with a “master” control. These will not control lights on their own.

Companion Switch

A companion switch allows for switching from multiple locations when using Lutron digital switches. These will not control lights on their own.
